Measures in cm

KEY FEATURES

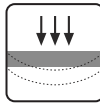

SHAFTS

Python Twist Tech: the bottom part is reinforced with additional carbon bands that increase shaft stiffness and provide shock resistance to the pole.

Best carbon compound to give maximum lightness and stiffness.

STIFFNESS: We measure here the flexibility of the shaft. The 80cm length of the lower part of the tube is stressed until it is bent by 15mm. The resistance is measured in kg and corresponds to the weight of the thrust. The results were divided into 3 categories, namely:
1 = superior (from 17 kg to 21 kg)
2 = good (11 kg to 14 kg)
3 = medium (7 kg to 10 kg)

Rubber cover for tip protection during transport.

UNPAINTED: The lower part of the pole is not painted, which makes the shaft more solid and greener (reduced use of paint).

SWING: A good balance of the pole leads to a better momentum of the movement. The balance of the shaft is measured in cm starting from the centre of gravity of the tube and calculating the difference between the lower and upper parts. The results were divided into 3 categories namely:
1 = superior (from 13cm to 16cm)
2 = good (6cm to 10cm)
3 = medium (2cm to 5cm)
